1. USER STORIES

A survey was conducted among students with the objective of knowing their preferences and needs when using a virtual electronic products store. The questions were intended to gather information about essential functionalities such as the login process, the shopping cart experience, and the checkout process. The survey sought to identify specific features that students consider important to improve their overall shopping experience in a digital catalog.

The questions and their results were:

2. ¿Qué información consideras esencial al registrarte en una tienda en línea?

[Más detalles](#)

3. ¿Qué tan importante es para ti poder ver categorías de productos?

[Más detalles](#)

4. ¿Consideras la opción de buscar productos por marca?

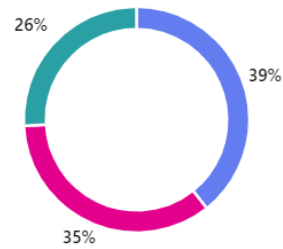

[Más detalles](#)

5. ¿Qué funcionalidades te gustaría tener al gestionar tu carrito de compras?

[Más detalles](#)

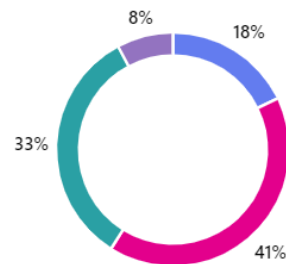

● Agregar/Eliminar productos	35
● Ver total del carrito	31
● Guardar carrito para más tarde	23

6. ¿Qué información consideras necesaria al momento de realizar una compra?

[Más detalles](#)

● Nombre	16
● Dirección de envío	37
● Método de pago	30
● Número de teléfono	7

Once the students' responses have been collected, the following user stories are created:

- “As a customer, I want to add products to my cart to check how much I need to save.”
- “As a systems engineering student, I want to edit my shopping cart because sometimes I can change my mind due to new technology.”
- “As a customer, I want to search for devices from my favorite brand easily.”
- “As a student, I want to see devices in a price range to know which ones fit my budget.”

The needs of the users will mostly be covered with the proposed features and the most voted categories. However, when reviewing the students' responses, it was noted that they would also like to have other options. Therefore, the shopping cart experience will be improved, allowing users to view and delete products. Additionally, a feature will be added that lets users search for products by typing the brand name directly and looking at products within a price range.

2. CRC CARDS

StoreUser	
Store user information (username, password, full name).	Admin (inheritance) User (inheritance)

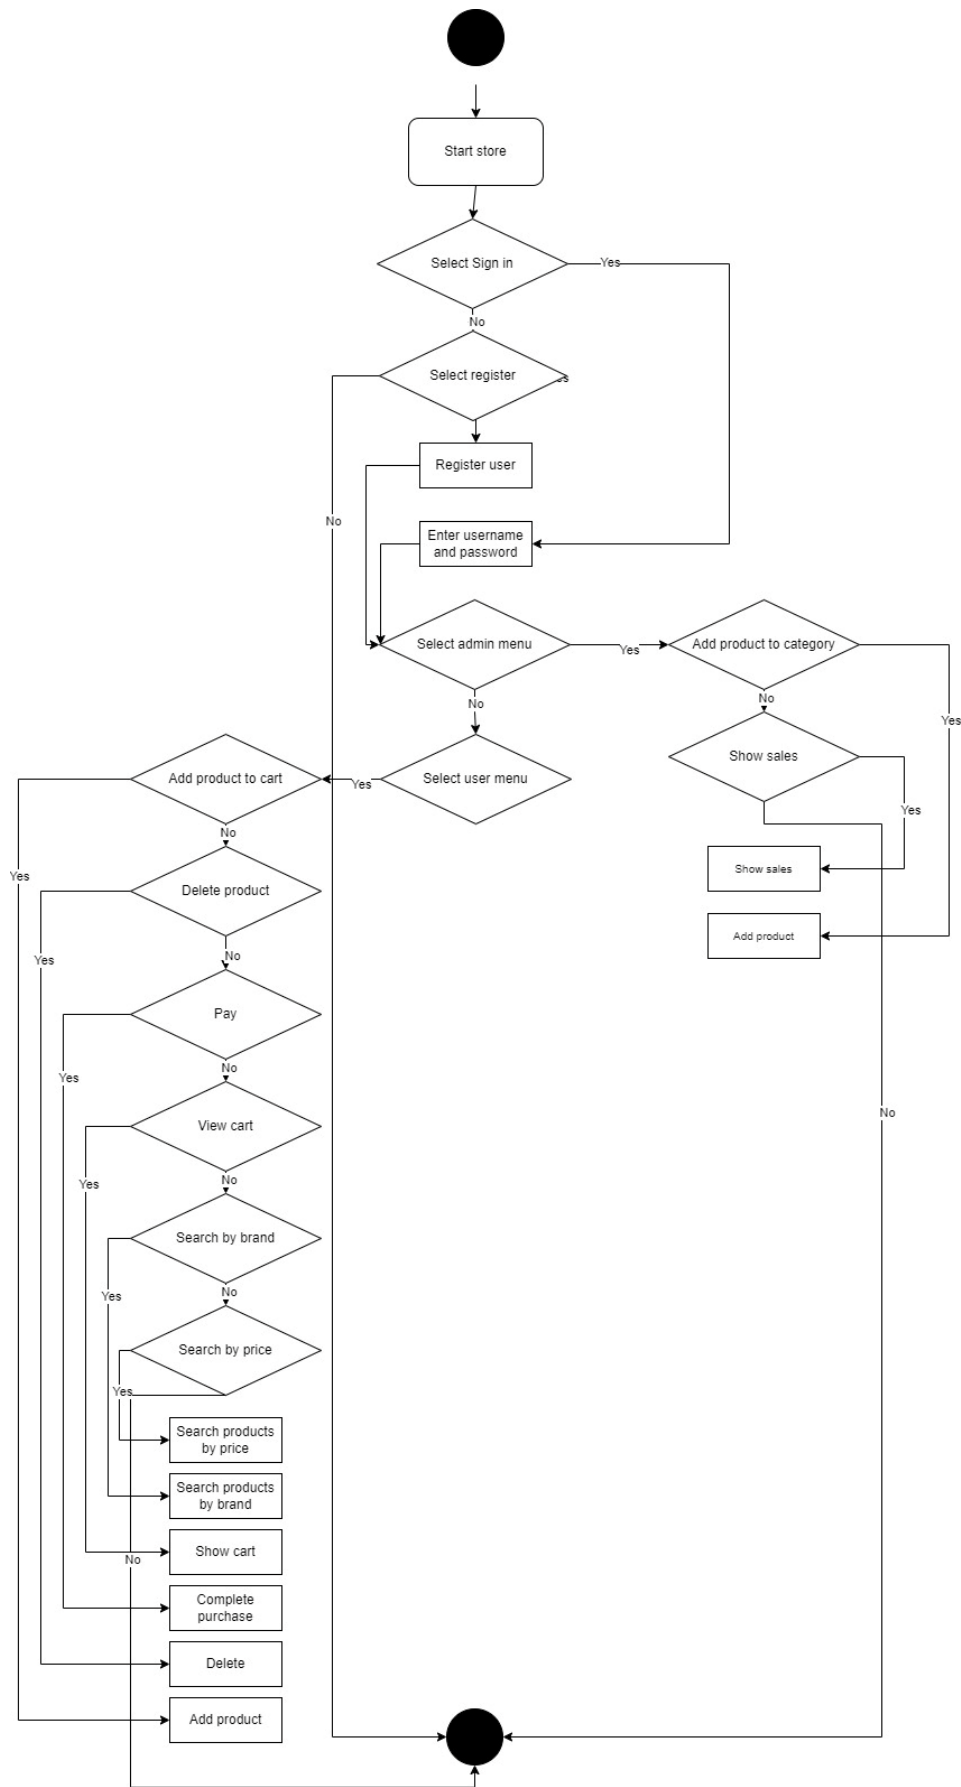

Admin	
Represent an admin user. Allow management of products and sales.	Store (composition)

User	
Represent a regular user. Allow purchasing products and managing the cart.	Store (composition)

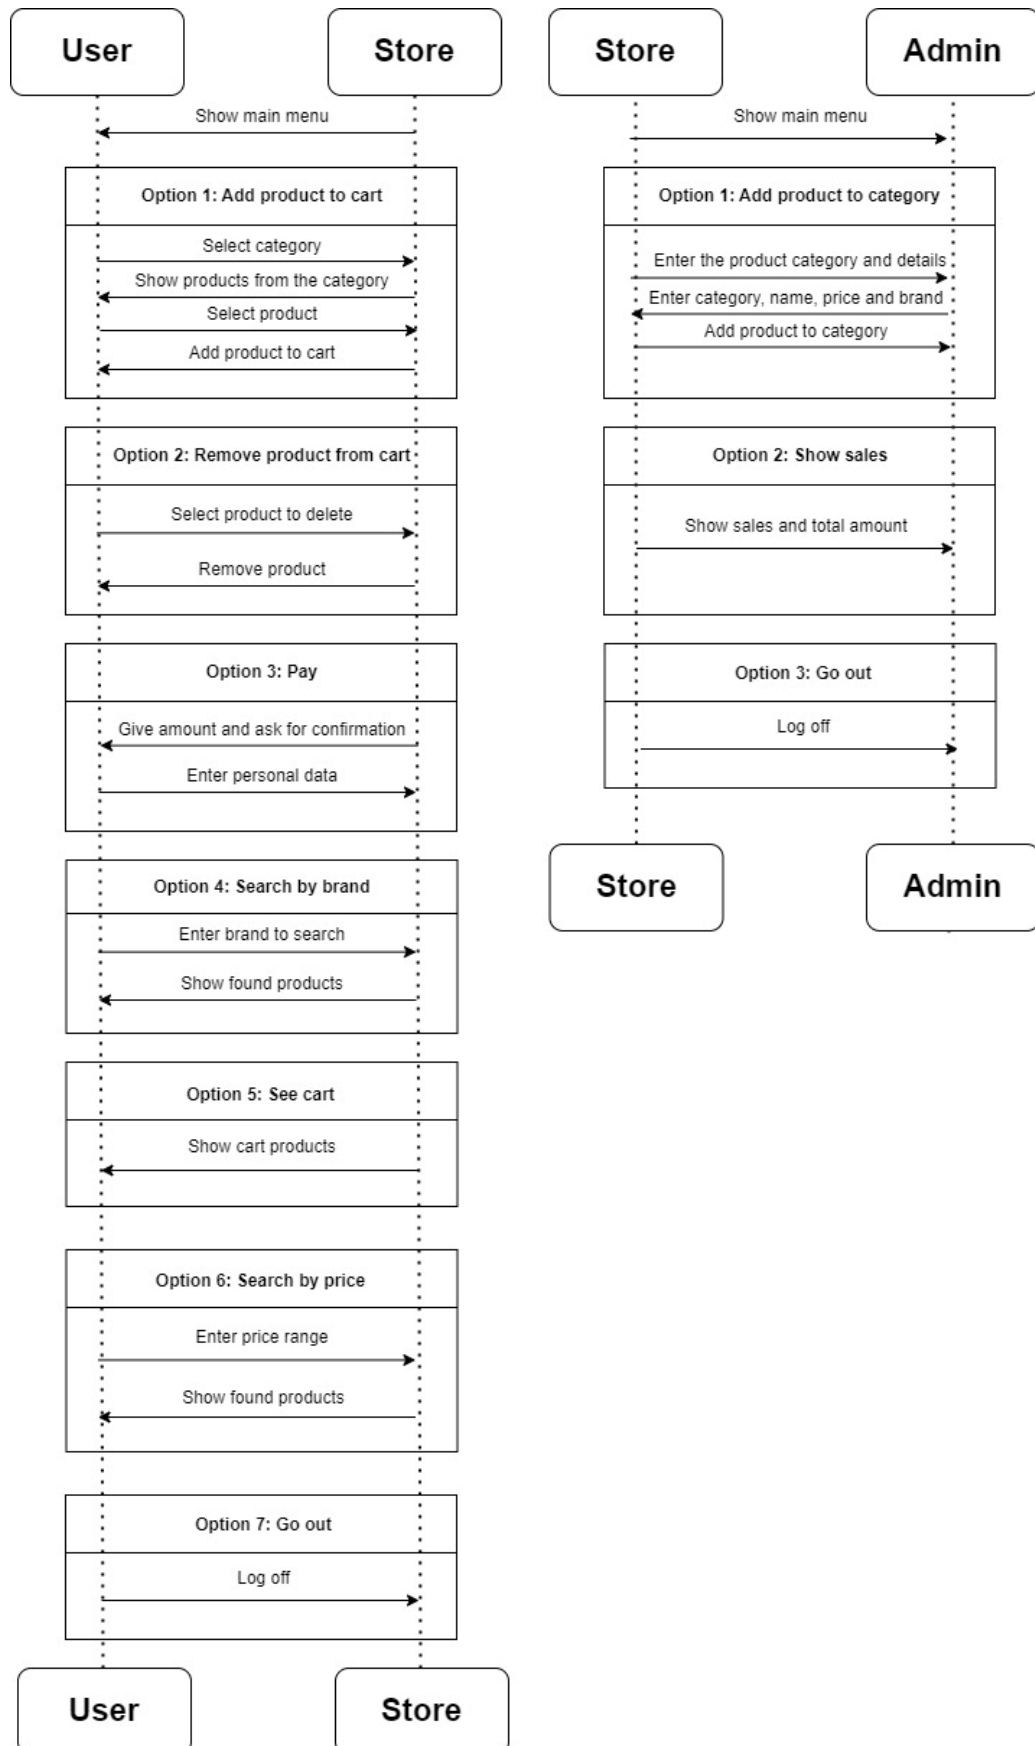

AbstractStore	
Define the interface for concrete stores. Declare abstract methods that must be implemented by subclasses.	Store (inheritance)

Store	
Manage categories and products. Handle user registration and authentication. Process purchases and manage the cart.	StoreUser (composition) Admin (composition) User (composition)
